I agree on both counts, the use of balanced pairs when possible and the attention paid to reducing the likelihood of ground loops, which is why you only connect the shield at one end.

But sadly, neither is an issue for Rusty, who has devices that use unbalanced RCA connections.

And I wonder about Barry, who started this thread. His problems were mostly impedance-matching and lossy inline filters. How's it going there, Barry? Did you find a solution that worked for you?
