Not tired anymore (much) and started playing with cathode resistors. I have a single 5000 ohm wirewound resistor hooking all the cathodes together, bypassed by a 1000 uF cap, and get these results:Plate= 440Screen= 340Grid= -25.5Cathode= 15What voltage should I be shooting for on the cathode resistor seeing as I've reached the maximum the bias power supply can put out?Dave
