Wayne, thanks that is very helpful and most interesting info! Looks like both remain viable choices depending on what room I end up with.

IIRC your previous comment on listening fatigue had involved the 2-way designs (3pi, 4pi), and pointed towards shorting ring vs. non-shortring woofer being the differentiator. Thus, I did not even think about the horn!

I assume the Delta 10/horn crossover point/topology/other are different enough from the 2-way's then, to effect the horn loading distortion?
