Subject: Re: simplifying the Guinevere Posted by Damir on Wed, 05 Oct 2005 18:07:19 GMT View Forum Message <> Reply to Message

Wayne said while ago (if I remember correctly) that his version would be with anode choke in the place of CCS, output from 5687 anode. The output resistance is rp in parallel with anode load (choke AC impedance), or simplified (if we assume large L / AC impedance on all "frequencies of interest"), about rp~2,3 kOhms.Large resistor parallel to the output is mostly for "cap discharge path" and some load if we use the preamp without amp load.
