(Wash DC-Metro Area Only)

Hi All,

I'm looking to sell a partially complete 4 Pi Build.

I've abandoned the project mid-way. I was building a set for my parents, as I got closer to completion, my brother ended up gifting the pair that I gifted him to my parents instead.

I was contemplating completing the project, but it hit a snag. One of my JBL 2226H driver "buzzes" at low frequency (120hz and less). It may be the dust cap, it may be the coil. Don't know, but I don't plan on sinking any more money into the project.

I currently have the following:

Pair - 4Pi Cabinets - built with 18mm Baltic Birch Plywood - the enclosures were built taller and the horns were centered for aesthetic purposes. No standing wave issues with the tall cabinet - this was verified via impedance sweep and close mic measurements. The enclosures were heavily braced and were finished with water-based poly.

Pair - Wayne 4pi Horns

Pair - Denovo DNA-360 compression drivers (apparently a direct clone of the DE250)

Pair - JBL 2226H drivers, one works flawlessly, the other has a buzz at low frequency.

Not sure what is a fair price, but I was thinking \$400 for all of the above?
