I was thinking about our discussion last night, and it occurred to me that your point dovetails and highlights my point. Your comments suggest a viable solution, and I guess that's what surprises me most about these internet radio manufacturers: Why don't they embrace that approach instead of making and selling products that are so vulnerable to obsolescence?

Maybe I should make one. I tend to use development systems like the Raspberry Pi solely for proof-of-concept, and once a design starts to materialize, I trim down to the processor, memory and I/O needed. So I wouldn't probably use an off-the-shelf development system and instead would have boards made with the specific subsystems and components desired.

But honestly, I have my hands pretty full. I make specialized devices and equipment for large companies and it keeps me busy. My customers order way more devices than I would ever sell to a consumer market, so I tend to keep audio as a side-business/hobby. Probably means I won't end up doing this. But after seeing the way Grace Digital has gone, I definitely do think about it. I think there's a market for it.

Hey - speakin' of the Raspberry Pi - have you downloaded my little Jinx text adventure game for the Raspberry Pi? If you haven't seen the post, give it a gander. I think it's worth a few minutes typing, just for fun. :)
