The Omega driver's recommended vented enclosure is 3.28 ft³ with an Fb of 48hz. I think the 4pi is 3.14 ft³ tuned to 42hz. I could keep the woofer centered in its enclosure or move it up closer to the horn. Perhaps I should make the woofer enclosure slightly larger and use closed cell foam to decrease it to desired volume. That way I could move the foam if I needed to change the geometry.

I will test for standing waves, but any tips on box size, tuning frq, and driver location would be appreciated.
