I don't know how serious miniscule resonant vibrations of the side panels might be as far introducing tracking errors to a spinning disk. I suppose that somebody has researched vibration vis-a-vis tracking errors, because it is important for portable cd players that joggers and others wear.I suspect, however, that it is pretty minor. "Tweak" would be the appropriate term.I do know that over 40% (it may be more - I forget) of the data on a cd is sophisticated error correction code (of various levels). So, there is quite a bit of room for correctable errors.
