My personal opinion; but it seems the minimum spec in terms of connections is labeling. My point is that you can use whatever connectors your like on the outputs and label them appropriately and you'll be no worse off than a regular consumer AV receiver.

I think a variety of speakons still leaves room for incorrect connections, but I haven't studied if some collection would accomplish your one goal.

The only sure-fire way to prevent incorrect connections are a variety of connectors, like 1/4" phone for one, speakon for another, and banana for the other. Can't mix those up, and all are certainly viable for speaker connectors.
