I think I didn't quite convey my concept. Rather than convert to the midhorn with the bass contoured in by the huge inductor, I am thinking of using the 2Pi BR box alignment unaltered in the existing boxes, and building in the tweeter and it's horn where the dome tweets sit presently.

I could use a new crossover based on your existing 2-way boards. This mostly would involve modifying the low-pass section to match the 10" alignment up with the HF components. I'd call it a 2.5Pi, Maybe.
