I've moved the TV as far right as I can. Any further and it blocks the hallway where the couch is. I wish there was more room.

I played around with the dimensions on the sub and there is not a way that everything fits back there. From the top view, the sub already interfered at 14" sq, 20" sq is 3x the volume. I really thought my biggest hurdle to good sound was going to be money, not physical space. Really both sub and speaker need to be smaller to fit.

I really wanted to build exactly to plan, but it seems the only way forward is to change something. Maybe build a 80% scale version or the 4pi with 3pi internals, buy a microphone, and see what I need to do the crossover to get it to work out? The whole reason I'm here is I don't want to reinvent anything, just use all your blood, sweat, and tears! That, and I think your waveguide is the best available! lol
