---

I bought my 2 Pi speaker kit 16 years ago. No problems hooking them up to any amps over the years. Recently I have had trouble with them on SMSL amps only.

They put out what I'd call "digital static". Like what it sounds like when you feed digital coax cable into an RCA audio input. It happens to both speakers, and both speakers work fine with other amps. I have replaced the SMSL amps with other SMSL amps and the problem remains. The SMSL amps work fine with other speakers.

The static does not increase or decrease with the volume knob, and I can barely hear the source playing. It happens on all inputs regardless of whether there is a source playing.

Does anyone know what sort of problem would cause this problem between a specific amp type and a specific speaker type?
