While I was staying in Atlanta, I was very good when it came to turning car radios to that. I always got old steroes from my cars or the ones parked in the junkyard.

All I gotta do first was handle the power demands because car stereos run on 12 volts DC. So, I used an old computer power supply from a thrift store in Decatur for it, which always worked.

I got speakers on Craigslist in Atlanta with boxes made from boards that I purchased from the Home Depot on Buford Highway. Doing all of that didn't cost much, and even when the sound wasn't that loud, I would say it was better than what I had with those little Bluetooth speakers.

That was one of the projects that I truly enjoyed doing while I was in Atlanta.
