Rusty wrote on Wed, 19 August 2026 16:53I helped a friend build a pair of 2Pi Towers a couple of years back. They're tower speakers, with high sensitivity drivers. The build is a rectangular box and a rear port without a tube. Just the thickness of the mdf used for their construction. A very simple crossover. And they sound dynamite. My friend had been using a pair of Technics 2 way budget bookshelf speakers he'd had since a teenager. The transition to these was staggering. I'd built a pair of Pi horn loaded bass reflex speakers years before that are BIG and sound BIG. I use tube and solid state amps with it. High sensitivity speakers have quenched my desire for fidelity.

They look stunning. Perfectly positioned and matches the wall color.

How much did you spend in total in assembling everything when you did a few years ago? Can you remember?
