Subject: Does room size alone determine which speaker is best?

I've always known that speakers are recommended generally based on the size of a room. A lot of people would always ask that bigger speakers are gotten for rooms with bigger spaces.

While that approach is great, I am of the opinion that there is more to it, like getting the maximum output, listening distance, placement flexibility, sensitivity, room acoustics, and bass extension. Considering these factors are good when we talk about how good a speaker can function in a given space.

So, what factors do you always consider when matching speakers to a room?

Do you begin with listening distance, room dimensions, bass extension, or something else? I would appreciate it if you shared what combinations work wonders for you.
