We moved to the new house about a month ago. The speakers are done. The whole system is now setup using alternate SET amps for the center and rear channels because I still need to finish the Paramounts. Anyway, we're enjoying it a lot. Here's a picture of the front section:and the rear section:

That's awesome! How does it sound? Do the amps have enough "oomph" for action movies?

So far it sounds awesome. I still need to build the center channel and surround amps because currently I'm using 2 watts for the CC and less than 1 for the surrounds.It looks like it'll be able to handle the oomph without any problem. I'm currently crossing over to the SW at 40hz so if I feel I need more power I can raise that frequency to 60 or 80 HZ and relieve the amps from the very demanding low frequencies. The SW has a 1.4kW amp!Thanks for your comments and help,xavier
