Never heard of that model from Altec Lansing. They made a 421 you could get in 16 ohm's at one time. What diameter is it?Bill W.

Here's what I found on the Lansing Heritage web site for 291's, it looks like it's better if you can cross them at min. 800Hz, depending on your horn that you attach them to. Plus you'll need some tweeters to take care of the upper end since they start rolling off at 13khz.Bill W.
