By "SEP" do you mean single ended pentode? Perhaps if you tell us what amp you're using, someone here will have experience with it and can give you their impressions on how it works with

wouldn't say they're blaring loud, but they'll surprise you with what they can do with two watts.As for room size, you have a lot of good choices there too. All but the largest speakers work well in

cornerhorns with 15 inch woofers in 12'x14' rooms and they sounded very nice. That's a pretty small room for speakers like those, but as long as you sit more than a couple feet away, they

for small rooms. They don't take much space and sound great. If you have a little more room,

good if size isn't a problem and you can sit more than a couple feet away.

I run my towers with a 3/4 watt 12B4 SET amp in a 15x14' room. They get plenty loud for normal listening. You ain't gonna shake stuff off the wall with less than a watt, but many people are surprised at how loud they will get. And the tube amp should offer some nice soft clipping at louder levels.

Dan,I have used the 4 Pi-pro with great success on 45/2A3/300B/EL34/EL84 single ended amps with less than 7 watts output.I also have used the JBL 2226J which is a 16 ohm driver with the 8 ohm taps on the SET/SEP amps with great sound due to the increased damping to the output tranny's.Do a search on this forum and see posts I and others have made in this regard. There is much info to be read concerning this topic!Hope this helps!Regards, Ron

I was wondering if using a higher impedance speaker might help out the dampening factor. I trust that's what you found. I'll check out your thread.Thanks!Dan

I agree the 16 ohm on the 8 ohm taps works well with my "single-ended" amps, but much less performance when using "push-pull" tube amps.Regards, Ron
