with the tweeter so it doesn't attenuate it. The shunt resistor provides a little bit extra damping,

resistor reduces that peak. Without it, more low frequency energy than wanted would be developed across the tweeter.

OK ,its a 16 ohm thats what the diagram said but it had a 5 uf. capacitor and we are supposed to use a 10uf ,is that correct? Thanks.

inadvertently sent that schematic out for a while. If you got the wrong schematic, I apologize. The
