Could you add the omega-15 to the eight-pi, section off the midhorn ,run the 5 mh. coil to the Omega -15 positive side ??? AND RETUNE THE PORTS to 38 hertz. Would this work ??? No two corners for cornerhorns ?Thanks.

midbass and lower midrange radiate into halfspace or quarterspace instead of eighth space, and there are penalties, both in terms of directivity and boundary loading. But if you don't have the corners, then those options aren't available anyway. Personally, I like my cornerhorns and my two-ways. Both sound great to me. The cornerhorn is definitely a better speaker but the two-way is 95% as good, so the midhorn and corner placement are Nth degree things. If I didn't have

DE250. Either way, add subs for smoothest bass. You can do it a step at a time, making your mains first and then adding subs later as an upgrade path.
