I am going to have to make my 2 Pis from 3/4" material instead of 5/8" and understand adjusting dimensions +1/4" in all directions to maintain the proper cabinet volume. Regarding the port length, do I need to maintain the overall 1-7/8" port length or do I add 1/8" to the port length to maintain the same port length inside the box? Also, am I correct in thinking the edge of the port cutout should begin 2" from the bottom and 2" from the edge of the assembled speaker cabinet face? Thanks

Make the overall port length the same, 1-7/8". And yes, the edge of the port is 2" up and 2" in from the side. I like to make a stereo pair in mirror images, with one port on the left and the other on the right.
