I have no idea where to put this question so here goes:TC, you mentioned some time ago that you did the manufacturingfor some Speakerlab speakers. I got a pair of the S-1's for use as HT surrounds about5 or so years ago when my interest in speakerbuilding wasgetting going for real. I have used the cabs for experiments in sound but myquestion is: Do you have drawing and construction detailsthat aren't proprietary for the boxes themselves? The S-1 box seems heavier and more dense (using the knucklerap test) than other enclosures I've encountered. Justthe materials and joinery method is what I'm interested in.lon@athenet.net

The material is probably 45 lb industrial particle board, veneered on both sides. MDF was not even available commercially back then, or at least it wasn't stocked. A total net thickness of 13/16" would confirm this. Probably just a mtre'd and braced cabinet. I did Speakerlab work but that was the mid 70's. Ya taking me back.TC

Ok, I was mistaken on when you did work for them but I alsohad Speakerlab product in the 70's and that takes me backas well. At that time and well into the 80's I felt good if I could just get through the physical assembly of componentsand pre-assembled crossover. Since I currently have a question in here on Voigt pipesI'd also like to open up a dialog on your Bigger Is Betterproject shown at Full Range. I'll review what is there beforecontinuing with that. Ooops. Is anything even _in_ archivessince James changed over to the new format?
