Of the many new machine-assisted tools that seem to appear daily anymore, thought this diyA link may be of interest, here. It's a bit more "hardcore" in the sense that a full set of polars is expected (lends itself to vcad workflow), but such is the case for at least a subset of DIY'ers here. You can do everything that makes sound for free, but impulse becomes monetary. The world keeps moving fast.

That looks like a useful program. I see that cost is $470.00, payable over 12 months.

CARA was $50.00, but that was 25 years ago. So the price today would probably be about the same.

Cool link! Thanks for the heads-up!

Not-selling, but I think it's 29 Euros for a 12 mo period but only for that "Pro" stuff which seems "bling" to me at this point. I've only ever had simple s/w crossovers (pulseaudio crossover rack) running, so the ability to learn / hear more sitting on my butt w/o horsing everything around is interesting, but I admit to simple curiosity just to see what can be done with only 1st reflections. I honestly don't have the hardware it needs to do better. He's posting by the minute and really in the throes of it...right this moment, too! :) He's a very good guy I've been reading for years and it's fun seeing guys that still have fire in their belly--eggs us all on and makes us smile, or at least it does for me. Best to all!

I agree. It looks like a really good software package!
