Hi

now I start build 2pi tower, I use 3 / 4 mdf

but are the dimensions of the drawing inside?

If they are outside they will probably get a little less volume?

best regards

Arne Olav S.

The dimensions shown in the plan are outside dimensions. The difference in volume between cabinets made with 5/8" or 3/4" material is small and there is much more change caused by the electro-mechanical shift of the woofer at various power levels. If the alignment was so unstable it could be upset by a tiny fractional percentage of interior volume shift, the speaker would sound vastly different at various power levels. So don't get hung up on the small difference of internal volume between various panel thicknesses.
