I'm following the threads here about decor in relation to sound and sound proofing. the thought of plastering styrofoam or egg boxes on my walls makes me shudder! I am going to go for the full ritzy red carpet look. I want tassles, velour and plush armchair seats with side tables. Does one have to sacrifice style for sound?

I'm pretty sure that egg boxes can be covered with velour if it comes to it. I hope you aren't gonna forget the popcorn machine and ice-cream freezer to add to that atmosphere . Seriously though, if it's what you want and you can do it then go for it is what I say.

I'm all for the right to make a room look good, but the sound and technicals in general have to be first! In order of priority I think about how somethings looks, how it sounds, vision, lighting, comfort.

Speakers with controlled directivity can really help sound quality from 200Hz up, even in troublesome rooms. And multiple subs help smooth room modes, improving sound quality at lower frequencies. So some of the problems room acoustics give us can be at least partially mitigated with the right speakers and setup.

I so agree! After setting up your sound system, you then decorate the rest of the room. It makes it a lot easier, and you don't have to move things around to re-wire, etc....

Relax Danny Do not sacrifice style for sound if you wish. Have your tassles, velour and plush armchair seats with side tables. You can design the acoustics based on your room layout later.

Hey, you'd be surprised how nice some dark colored egg shell can look!

Seriously, though, design and install the sound system first and make sure everything is good. Then start worrying about aesthetics. I'm sure you can figure out a way to get the look you want without compromising sound quality, and vice versa.

This is the best advice but I think this is costly. How many subs would you recommend in order to have a good sound quality? Anyway, I watch movies at night and aesthetics doesn't matter to me anymore because the room is dark.

Use two to four subs in different places in the room for best sound quality. In some rooms, two is enough, especially if the mains provide adequate bass too. The idea is to spread the sound sources around, to smooth room modes. You want multiple sound sources in the modal range, below about 150Hz. So if your mains don't provide much bass, go with three or four subs. You can go with more than four subs, but the concept of diminishing returns applies here. Multisubs
