I am somewhat handy, and I know how to "connect" my soundsystems, but I am not so good when it comes to the inner workings of it all. Is it possible to take a short course somewhere? I am not trying to get a degree, or anything, but I would like to maybe learn a little more...

That's a great idea and you never know, it may develop into a life long hobby. I am pretty sure that there will be some kind of local education center offering this type of thing. Why not have a look in the library - I find lots of things available in my area are advertised there.

You might as well get the degree.

The two books I have on analogue electronics encompass a masters degree, which is why we didn't use the whole book in either case.

It's an insanely difficult subject to learn if you actually care about why things happen.

The web site that you're on is your short course buddy. Seriously though, if all you want to do is learn more for your own personal gain, not to make a living from the knowledge, then read some well written, relevant material on the subject.

No need really to spend a lot of time and money on something that is just a hobby, right?
