Why is it that the sound coming from the musical instrument has a different quality when a microphone is placed near it? In our Christmas party last December, a friend played the violin and it sounds better without the microphone placed beside it.

It depends on the microphone. If it can get you a flat, 20-40Khz response, I don't know what the problem is, but usually a mic compresses the audio due to its bandwidth limitations.

Likely they had no idea which microphone to buy and got something that was not flattering to the sound.

I forgot to mention about the speaker they used for that event. It was a very old one already. I'm not sure whether it is the microphone, the speaker, or even the amplifier that they used that made the sound terrible.

I think the problem with capturing any audio event is getting 10-20Khz recorded accurately, but just as important is 20-40Khz, we can not hear those by themselves, but when they are created as a function of a single "sound" they become critical.

Naturally, most mics start rolling off above 3.5Khz, especially vocal mics. This is exactly why 10K dollar condenser mics exist. They will make it sound real.

Microphone choice is one of the first important decisions to make when recording, as well as

placement.

Of course, bad amps and speakers would definitely effect the sound quality too.

You mean \$10,000 for just a mic? I might create my own recording studio if ever we will use that kind of mic. Can the amp correct the regular mic that we have? I might have to do this on the next event that we will use this audio setup.

There are a lot of condenser mics, a \$10K one is an extreme example.

They make great stuff for 500-1000 bucks in condenser mics.

There is really nothing you can do to a dynamic mic to make it respond like a condenser mic.

Dynamic mics are for percussion and live sound really. They do well with guitars and bass because of those instruments' narrow bandwidth, so that's not out of the question.

I agree with Adveser somewhat, but you said the majic words right here:

"I forgot to mention about the speaker they used for that event. It was a very old one already."

Depending on how old the speaker system is, some of the 'old school' midrange drivers started rolling off 6.5khz. It wouldn't matter what kind of high dollar(full freq. range mic)you used, like Adveser said. The speaker system would not be able to reproduce it no matter what mic placement. That's why the violin probably sounds like crap when they mic it.
