What are the proper thickness dimensions for plywood in metric sizes?

Do I have to make some adjustments, for example for the baffles, or do I just stick with "inches" measurements?

Speakers website. Scroll down to the bottom of any page and you'll see the link.

Accuracy to the nearest available millimeter is all that's required. You can use 19mm wood stock in place of 3/4", for example. Even 18mm is fine.

Thanks, it was the woodstock size I was interested in.
