Hi everyone,I was given some small output transformers a few years ago. I was told they were from a Fisher reciever that used 7891 output tubes, but they did not know which model.I have looked on ePay at the pictures of a Fisher X-100 reciever. And the transformers that I have, appear to look close to those.The part number on the output transformers that I have is T-799-116.I hope someone who knows Fisher equipment, or who has a parts list of the Fisher X-100. Can help me to identify these output transformers?I was hoping that these transformers could be used for a PP 6AQ5/6005 amplifier.Any help will be greatly appreciated.Norris Wilson

Why not e-mail Al Pugliesi; The Fisher Doctor. He would definately know and he's a friendly guy.

It has no tuning section, hence it's not a reciver. It also runs 6BQ5/EL84 tubes in the output stage -- What you prob. have are trannies from an x100-b or c - or other - slightly later integrated amp and they, i'm nearly certain, run quads of 7591s (many, many Fisher, Scott, Sherwood, etc. run 7591's).Re: Al, he's a busy guy and while a nice fella, i wouldn't hold my breath waiting for a response -- if i were you, go to the vintage section of audio asylum and keep an eye out or ping jimmydee or smglaw (two very knowledgable Fisher guys) and see if you turn up anything.
