Salvaged what I could out of these images. I realized about half way through the shoot that I screwed the exposure. Started out spot metering the moon while zoomed in and then backed out for a wider angle. I totally forgot the lens's f/ stop opens up on zooming out (f/5.6 to 3.5), so I got a totally over exposed image - no detail of the moon. Oh well - live and learn. Each exposure was taken 20min apart. Used ImageStacker/Picasa to edit.....

Wow, Colin, you're doing the coolest photography! I mean, really! The last two pics should be made into prints and framed. They're just stunning.

Hi, Most folks can't do that well when they try. I like the "arty" effect of the moon not being in focus.
