This was so easy. Why did I wait so long to get the clamps off the floor and out of the corners?

First, I needed a crosscut sled because the miter gauge that came with my cheap-ass tablesaw sucks. Second, I thought I needed a dado set for the saw. Second, Part B, w/o a dado set I'd have to make numerous passes with the standard blade to cut the kerfs.

Well, retirement's main virtue is time and it's evil counterpart vice, empty time. I had time to fill so I made the sled this A.M. and found a website that showed drilling a hole at the back of the kerf which means only 2 saw passes per. Why didn't I think of that?

Ecco! Clamps on the wall before lunch!

Now that's the right way to do it!

Just finishing one, waiting for the Cinemag transformers to arrive.

Will start construction of the 2Pi Towers when I get back from Ribfest next week

Nice, been trying to figure out a good way to store the clamps, that is nice and tidy.
