Anyone interested in these little beasts there is a good site providing extensive measurements and modification for the Tripath chip and the Sonic-T.octopusamps.comHe sells a modded version but he also provides for free a BOM; a Q&A and all of the schematics for the mods. Including photo-imaged build help and e-mail help. Very nice stuff. I can see a great system with the Pi II speakers and a panasonic portable CD/MP3 player. It shouldn't break the bank at about 300$ for everything. He deals with the issue I brought up earlier that the amp will get a tad shrill at times. You might find his measured response printouts interesting.

All you need is some old cardboard boxes and the little soundpax vibrator; does the same thing.I like the Brian Bell GC better myself and you can tweak it easily.
