I have an opening on one side of my long (front) wall that is 52" and the other is 56"

Is that enough to make the magic work?

Will the four inch difference make bad things happen?

I doubt that will matter at all. But you are right to consider the room symmetry, because that is important for constant directivity cornerhorns.

You want the first six to eight feet to have unobstructed wall space, and to have no openings. You can have some differences in features, things like closed windows, paintings, even small shelves don't hurt. But large openings kill it, and some furniture can too. Things like having a sofa along one wall can create enough absorption in the midrange to shift the balance, or a table on one side can make an unusual reflection that also shifts the balance. Imaging suffers when those kinds of things are in the way.

This is a drawing of my room. I left out the drafting lines.

The apex is 2.5 feet in front of the listening area.

Will this room work well or should I look at a different solution?

TIA,

Vince

Hey Vince, add the things that Wayne talked about to your drawing:

You want the first six to eight feet to have unobstructed wall space, and to have no openings. You can have some differences in features, things like closed windows, paintings, even small shelves don't hurt. But large openings kill it, and some furniture can too. Things like having a sofa along one wall can create enough absorption in the midrange to shift the balance, or a table on one side can make an unusual reflection that also shifts the balance. Imaging suffers when those kinds of things are in the way.

Are the openings windows/doors/entranceways, are they closeable? Big furniture items: couch, stuffed arm chair, shelf etc ... Listening positions (all)?

Then Wayne can give you "custom" advice!

I'd rather have a little more distance in the flanking walls, but that's enough to work pretty well. I think it'll sound great.

Not much in the room. A very short equipment rack centered on the front wall, a very long leather couch on the back wall and a projector on the eight foot ceiling. No windows.
I can extend the two walls if I need to.

And where is a good place for subs?
I'm guessing right in front?

Set them up per Welti or Geddes.

When you get to four bass sound sources (or more), it almost doesn't matter where you put them.
So put them where convenient.
