Hi,

Just built the flat pack midrange horns which will be fitted with the recommended Eminence 10" driver. The horns are enclosed in a sealed box sized to fit on top of my bass units. Given that the internal volume is not critical for the lower frequency cut off (275Hz) has anyone got any recommendations for type and amount of stuffing? Cheers

Use fiberglass insulaton and be sure to brace all panels.  See the following links for more suggestions:
Midhorn bracing
