Hello,

Could you please send me the 7Pi plans.

Thanks

Can you send me plans?

I want build universal speakers for modern music (trance) and for jazz maybe you can describe in a few words differences between 4pi and 7pi. I mean to compare 4pi and 7pi in different styles of music.

Thank you, very much!

The tonal balance is the same, but constant directivity cornerhorns have an advantage in that they do not suffer coloration from early reflections like all other forms of speakers do. They are acoustically close enough to nearest boundaries to act as though they were baffled by the boundaries. They make the wall behind and beside the speaker become a launch point, like a ground plane. So if you have a room with the right corners to support constant directivity cornerhorns, use them. If not, DI-matched mains with flanking subs are the next best thing.

See these links for more information:

High-Fidelity Uniform-Directivity Loudspeakers  
Speaker placement and wavefront launch  
Room modes, multisubs and flanking subs

My listening room is very small, only 7 feet 10" wide, and 14 feet long. Could 7pi speakers still be ok in this room? What is minimum recommended listening distance for 7 pi speakers?

If you think they might work, could you send me the plans?

You've got mail!

Your room is large enough, depending on how you layout the space. See the following links for more information:

High-Fidelity Uniform-Directivity Loudspeakers

Speaker placement and wavefront launch

Room modes, multisubs and flanking subs
