With all the technological advances we are making in other fields, how do you think the audio world will change? Do you see a day where you can simply "wear" your music in the same way that Google glasses lets you see virtual images?

Sounds like we are turning into robots!

On the topic, I'm not sure how audio world can evolve even higher than the current trend. It's already easily accessible, present in various forms. I hope for piracy to stop one day, but that's probably something too much to ask.

This is really interesting; I couldn't help but laugh out loud. I think the next few years will see great technological developments and advancements and we had better brace ourselves for that.
