Hey guys. I just want to know if concrete walls make your system sound different than other types of walls or not. Does anyone know?

Rooms with concrete walls suffer from very strong room modes because the walls are rigid and there is almost no damping. They can also be very reflective at middle and high frequencies. For that reason, when people install sound systems in basements where all sides are concrete, it is best to install acoustic wedges or other absorbent treatments and panel dampers on the walls to damp room modes. Multiple subs are always a good idea too.

My opinion is that concrete walls are no good to set up a system within. Concrete and music just don't mix. At least not the kind of music I listen to.

. . .when people install sound systems in basements where all sides are concrete, it is best to install acoustic wedges or other absorbent treatments and panel dampers on the walls to damp room modes. Multiple subs are always a good idea too.

Is that meant to contain echoes, to keep the sound from getting distorted, or to keep the sound from leaking upstairs? Do you think it's worse when the flooring is concrete too? I have a system in the basement and it's hard to hear it. But then again, it isn't an expensive setup. Just old gear.

Concrete surfaces on all six sides (4 walls, floor and ceiling) are problematic because there is so little damping. Reflections are strong and room modes are terrible. Even if you tame the high-frequency reflections with absorbent materials, room modes are still strong. Panel absorbers on all walls are generally the only way to cure them.

Would panel absorbers fully cure the dampening or would there still be at least some dampening issues? How much would it help if the ceiling wasn't concrete as well?

My apartment building is built with concrete breeze blocks and I noticed a deterioration in the sound my system produced after moving from my previous house (wood framed, brick built)

The concrete wasn't on all 6 surfaces, of course, there are windows! But there was still a difference in the quality of sound.

I bought some foam acoustic panels with which I lined the larger areas of concrete (floors, ceiling, and inner walls) and that helped.

I've been having similar problems, rarerat. I tried to fix it the way you did, but I think I must have gotten some low-quality panels. My dad gave them to me, so I didn't really research them as well as I should have. What kind of foam panels did you use?

A lot of "foam" absorbers are useless.
I have had much better luck with rigid fiberglass.

Just a couple of 2' x 4' absorbers made of 4" Owens 703-
http://metrosupplycollc.com/image/115872015_scaled_299x223.png
can be effective.

Just cover them with thin, cheap fabric.

I bought some foam acoustic tiles for soundproofing from Amazon. They come in packs of 12 and measure 2 X 12 X 12 inches. They got a lot of good reviews which is what decided me as I have no idea what "Overall Noise Reduction Coefficient (NRC): 0.67" means - but that is what they offer.

I'm pleased with the results so far.

Concrete walls are horrible based on reasons others have already stated. If possible, the best thing to do is to put up some framing and sheetrock so it's more of a conventional room. Some of the sound absorption stuff is only second best but given the choice of sound bouncing all over the concrete, it's better than nothing.
