Hello,I just bought a new Shure V15 V cartridge for my SME 3009 s2 improved.My 3009s2imp is manufactured in April 1976, serial# 212773I no longer have the original protractor.I have a question regarding the cartridge alignment null points.There is a huge confusion on the web regarding this subject!!!!Here are some of the data that I have found in various scanned SME brochures or instruction manuals:Original 3009 - single null point at 2 2/3 inches (cca 70mm)3009 II - single null point at 60 mm (I've also found a document mentioning two null points - 60 & 111mm early version, 60 & 115mm later version)3009 II improved early version - single null point at 60 mm (according to two null points document mentioned earlier - two points @ 60 & 117mm)3009 II improved late version - two null points at 66 mm and 121mm3009R - two null points at 66 mm and 121mmI didn't know that there are earlier an later versions of 3009 s2 improved.Which one is mine (April 1976, serial# 212773) ?What null point settings do you recommend for it?Thanks in advance,AleksandarPS I also have lost the original 1/16" hexagonal wrench.Where can I find one? Here, we only have tools based on metric system...

You have to go to the dedicated SME site or The Analog Dept or The Vinyl Zone. They have all that specialised info.

Here's the most important alignment fact I know: with all the protractors it's a best guess as to whether the line to the pivot is on the 2 dimensional point!Q.E.D. - lining up the stylus and cart on the grids is also a best guess so obsessing over millimeters ain't get you better sound.Listening will.Download the Enjoy the Music protractor. It gave me the same results as the mirror one I bought.
