Most people fail to get it right with the car audio system leading to a loud distorted sound. How best can distortion be removed and which is the best method of setting the speaker levels?

I have the same inquiry. Is it better to close all the car windows, have the windows a little bit open, or let the windows be opened? Do the car seats affect the quality of the sound in the car?

During installation, I included high pass filters both on the front and rear speakers and they work well when the volume is both at high and low, through regulation of the bass. I have also heard it said that bass booted music distorts the car speakers at low and high volumes and over time, the frequent distortion ends up destroying the strength of the speakers.

The best way to enhance bass in your car is the same as negating it only in reverse.

Since the acoustic capabilities in a vehicle are minimal at best, I just concern myself with the setting controls.
