---

about 2 weeks ago i purchased a new direct drive turntable and some new vinyl. Being used to my old clumsy belt driven turntable i overlooked the fact that there was a counterweight in the box that needed to be used. while playing some records i noticed a slight dragging noise, and knew that it was probably the cartridge rubbing against the record but again i overlooked the need of the counterweight. So now that i have the counterweighton i want to assess the damage of my needle and my new vinyl. my first question: Is there any way of checking the quality of the needle?> Second: I noticed that now while playing the records i hear slight pops(not skipping) associated with old vinyl. Is slight popping normal with new vinyl that was only played once or twice?, because I am wondering if the cartridge rubbing had anything to do with this. Any help would be appreciated. thanks Isaac

I would say your new vinyl is now old vinyl if you tracked at 10 grams forgetting the counterweight. Then again maybe not.

Yeah, without a counterweight, I'd say stuff probably got trashed pretty good. Might be best to start from scratch. (Pun intended)

Grunge, yeah, must be. Or maybe thrash. Maybe punk.
