My friend brought over their system and we played it in the kitchen. It sounded totally different than it did in the living room. She said it even sounds different at her place (she has paneling). Do appliances really make things sound so different? The walls are the same from my kitchen to my living room.

Rooms definitely have a big influence on the sound. Think about how things sound in a small room (like a bathroom) compared to a large room (like an auditorium).

The most significant influence is from room modes and self-interference from boundaries. To learn about these things, do searches here on the forum and on the internet at large for room modes, SBIR and self-interference.
