What are your go-to measuring systems?  I'm a hobbyist rather than a pro, so I just use
FuzzMeasure Pro because it's fairly straightforward and easy to use.  I haven't played around with
anything else though and just wonder what you guys prefer.

I use WTPro for development, mostly because of its ICD.  I run it pseudo-anechoic.

I use LMS for measurements that I publish.  I measure outdoors for measurements to be
published.

I've used REW in the past.  I settled on it because it's freeware and the other options can be pretty
pricey, plus they have more bells and whistles than I'd ever need.

Hi, I guess it depends on what I am measuring.  For speaker systems I use RTA and a PC scope,
sometimes I "cheat" and use the analysis section of a Behringer DEQ2496.  For gear on the
bench I have three different PC based scopes one stand alone scope and three different signal
generators.  Plenty of assorted meters, diy test fixtures. I also use a HP distortion analyzer when it
is appropriate.
