Hello,

I built a set of four Pi "clones", similar build but a tad smaller and no horizontal offset for the tweeter. I am trying to understand / learn along this process so my current crossover is probably far from ideal. I am using a MiniDSP device.

Any idea how I should set the crossovers and time alignment? Many thanks in advance.

Those look cool!

Here are some things to consider, test and check:

Phase angles, crossovers and baffle spacing

Baffle spacing, phase angles and time alignment, revisited

Crossover optimization for DI-matched two-way speakers

Cabinet design, port placement and internal standing waves

Damping material placement
