The details:  My room is 18 ft by 10 ft with 8 ft ceilings.  Speakers will be in front of the short wall, and can be about 2-3 ft in front of them.  Bass extension is not the highest priority.  I can use a sub if needed.

Which Pi would work best here?  Thanks!

You can use any of our models in that room.  See the Pi Speakers FAQ - especially the pages that discuss differences between models and options - to help you decide which model is best for you.

Thanks!  I'll have a more detailed look thru that.

One thing I hadn't noticed before:  The cabinet for the 4 is actually smaller than the 3.  Could you explain why this is, or just point me to any explanation that already exist?  Thanks.

The box size was just a function of the tuning.  You're right that the four Pi is a smidge smaller, but they're really very similar loudspeakers.  The three Pi has 3dB lower voltage sensitivity, with exception of the Delta Pro 12 variant, which trades some extension for sensitivity.  In all other cases, they have generally similar response with 3dB sensitivity difference.

Thanks for your responses.

Could you send me the plans for the 4 Pi?
