After reading the forums for a long time (4 years or so) I have still sought an introductory guide to speakerbuilding theory thataddressed those completely new to the hobby. And I found it. "Speakerbuilding 201" is a new book published by Audio Amateur Pressand Ed Dell, the fellow who brings you _audioXpress_ magazine everymonth. After looking at the first few pages, I'd say that if I can't grasptheory here in Ray Alden's book, I never will. Ray has published previous volumes on speakerbuilding and teaches in a specialty high school for gifted would-be engineering students. The book has a lot of sidebars on math principles which I, forone, never grasped adequately at the time of my education. It is interestingly written and with humor which includes manyquotations of note. I am not well into it yet (I am slow to do so) but I believe thatthis book is worth owning for the theory, computer software examples and projects contained in it. Speakerbuilding 201 by Ray Alden ISBN 1-882580-45-1 $34.95[feel free to add this note to other speaker sites.]lon
