hey everyone im getting a pair of jbl jrx125 (heres the link)<http://www.jblpro.com/JRX/JRX125.html>  
was wondering what amp do i need to power them cause they say...Recommended Amplifier  
Power: 500 watts to 1000 watts into 4 ohms but with good speakers i need a good amp but still  
affordable my price range is from 0-\$350 so can you please help

At that price and power range I don't think you are going to have many choices. Check out  
[www.carvin.com](http://www.carvin.com). They make solid stuff at low direct to consumer prices. They have an HD1800  
at \$330 which puts 600 watts per channel into 4 ohms. More features, including some valuable  
ones like limiters, would jump you up o \$530 in the DCM2000 at 700 watts per channel. I have  
been running 2 DCM2000's for several years, one driving some HSU subwoofs and the other a  
pair of AR-9's. They are very good amps in my experience. You can sometimes buy these on  
eBay for a little less, but not much and you don't get the warranty that way. While there, don't look  
at their LS2153 speaker system as the specs and price may disturb you. Dick

Check out Crown XLS series or Behringer EP1500 or EP2500, or QSC RMX series amps.
