When looking at the frequency response for compression drivers using polyester (Mylar) diaphragms I have noticed that most of them seem to be much more flat & smooth than their titanium counterparts. (Examples include B&C DE25
www.bcspeakers.com/pdf/component/de25.pdf Beyma CP380M and Beyma CP385/Nd
<http://profesional.beyma.com/ENGLISH/pdf/descarga.php?pdf=CP380M.pdf>
<http://profesional.beyma.com/ENGLISH/pdf/descarga.php?pdf=CP385Nd.pdf>) Does anybody know if this smooth behaviour is due to the choice of Mylar or rather overall driver design (or both)? Cheers/Magnus

Polyester compression mids sound good to me but the highs are too rolled off IMHO. Ben
