Could someone place a rubber gasket over the threads of a compression driver to alter the extent it goes into its horn throat ?What would this do to the sound ?Would it change it, and if so, which way ?Of course, one could only move the driver "back" from its throat, and go too far, it falls out.Ever try this ?An old roadie says they used to do it ?

-Is when small dimensions are involved,like a few mm more spacing than normal- are HF muckups and reflections ruining the tiny[high frequency]waves !Actual experience and changes in the sound character,perhaps some one can comment on.CheersMike.e

I like it here, kind of a "kindler, gentler board" if you know what I mean ?
