Delurking. Long time reader, first time post. All this talk of dual horns has me curious. What good current designs are out there? What are the tricks to make one right? What rules/formulas/science determines the right relationship to front horn, back horn and driver? Cheers! Evan

You are asking for about a 20 page white paper that would just scratch the surface of what's required for a dual (FL/BL) single driver horn. It's very involved and has considerable trade offs. Or are you asking about a system that has two drivers that are horn loaded? ron
