Over at the Single Drive website GM gave the dimensionsfor a Mass Loaded Transmission Line using Fostex 127edrivers. I cut the wood to try these dims. out using70 cent shelving. I did the cutting for this quite while back. I thoughtI made some boo boos and nothing fit. Other day I got the pieces out and dry fitted them again. It was like the elves fixed them. Who knew? Of all the places to put the port on an MLTL, the bottomseems to be the preferred place and adding some sort of chute to focus the sound. Any ideas on this? Sorry, no *pic*. I had the item saved but couldn'tpull the website archive out of the whatevs. Tried the Wayback machine too.
